

Bisyou — Should we take it on?

Confidential investment memo (v2). Prepared by Claude (CTO/CFO) for Lucas Guimarães (CEO), NAMI Works / GE Beauty · 14 June 2026.

Revision v2 — incorporates your review (C1–C7): no GE↔Bisyou cross-sell and no Camila — brands run independently, only the operational structure is shared (C6); Boniteca finances inventory, paid M+2 after sale, so no working-capital outlay (C3); 2026 figures reframed as a 4-month run-rate (C4); cost-base "Ours" column broken down (C5); freight section corrected — charged-to-customer ≠ cost-to-ship, "doubles cost" retracted (C7); channel-collapse evidence surfaced with its limits (C1).

1. Recommendation at a glance

CONDITIONAL GO Pursue to a term sheet, inside the gates below. The thesis is narrower than v1: with **no demand synergy** (no cross-sell, no Camila), the entire case is an **operational cost-arbitrage** — take Bisyou's own revenue and run it on a far lighter cost base than the current owners can. The downside is genuinely capped; the upside is real but modest and hinges on one thing: whether we can acquire Bisyou's customers efficiently on its *own* brand.

Big picture. Bisyou loses ~R\$3M/yr at a run-rate and has been profitable in only one of five years — the cost of buying its customers always ate its excellent (~80%) margin. But the licensing structure hands us the *operation* with no debt, no labour, no legacy payables, and (because Boniteca finances the stock) no working-capital outlay. On our cost base — no debt service, lean shared overhead, marketing as variable CPA instead of fixed influencer retainers — the same revenue flips to roughly **R\$1M of EBITDA**. The brand's own-site business is durable (32% of orders repeat), so there is a real asset underneath. The bet is no longer "use GE's audience"; it is "run lean and acquire with discipline where the incumbents couldn't."

The gates (all must hold, or we pass):

1. **Royalty ≤ ~5–8% of NET revenue, no fixed minimum.** On gross, or with a minimum, the math breaks.
2. **We can run standalone acquisition at ≤ ~35% of net revenue.** This is the new crux: with no cross-sell crutch, the whole upside depends on marketing efficiency. Break-even is ~39%; the owners ran 48% (recent) and 32% (their one good year). **Prove it with a small paid test before committing.**
3. **May/June own-site revenue is stabilising, not still sliding.** We do not have these two months yet; this is a forward-looking diligence gate.
4. **License term long enough and cheap enough to exit** to prove the model pre-purchase; plus clean ANVISA, trademark, no live litigation.
5. **We cap the leadership attention committed.** The real cost is bandwidth pulled off GE Beauty, not cash.

–R\$3.0M THEIR CURRENT BURN (2026 RUN-RATE)	~R\$1.0M EST. EBITDA ON OUR BASE (ILLUSTRATIVE)	~39% BREAK-EVEN MARKETING (% OF NET)	~R\$4.2M BREAK-EVEN NET REVENUE (VS ~R\$7.6M RUN-RATE)
---	---	--	--

2. What is actually on the table

Big picture. A brand-licensing and operational takeover, not an acquisition. We run Bisyou and pay a royalty, with an option to buy later (~year five). We take the operation; we do not take the balance sheet. **The two brands stay independent on the demand side** — only the operational machine is shared.

Structure (clean handover)

- **No liabilities transferred:** no labour liabilities, no bank debt, none of the ~R\$1.9M legacy payables. Pre-closing items stay with the owners.
- **Supply unchanged:** made by **Boniteca** (same manufacturer as GE). Boniteca fee is a 10%→5% regressive success fee, paid only after sale.
- **No working-capital outlay (corrected):** Boniteca *finances the inventory*; we pay on consignment-style terms, ~M+2 after the sale (e.g. June sales paid the 5th business day of August). We pay only after the cash is in. There is no ~R\$1M stock pre-funding.
- **Marketing today:** influencer contracts already cancelled; Meta/Google agency runs to Nov-2026 (~R\$60k/mo media + R\$6.5k service, break fee on early exit).

Who we are dealing with

Cap table: **Disruptive Participações S/A 76%**, Ivan Pinheiro 12%, Carolina Viudes 12%. A financial holder controlling 76% and licensing out operations is a mild **negative-selection signal** — they could not fund or fix it. That is why the royalty and the purchase strike must be priced as the call option this is.

3. The brand's financial reality

Big picture. Bisyou scaled to ~R\$15M in 2024 and made money in exactly one year. In 2025 it swung to a R\$1.8M net loss. The four months of 2026 we have (Jan–Apr) run well below 2025.

R\$ (Contábil view)	2021	2022	2023	2024	2025
Gross revenue	2.47M	6.40M	9.81M	15.44M	14.79M
Gross margin	77.5%	82.4%	84.5%	85.2%	80.2%
Commercial spend (mktg)	0.91M	2.34M	3.14M	4.45M	5.20M
Net profit / (loss)	(0.20M)	(0.22M)	(0.40M)	0.62M	(1.78M)

On 2026 (your C4): we have only **4 actual months (Jan–Apr)**. The "–46% vs 2025 / ~R\$3M burn" is an **annualised run-rate, not a confirmed full-year figure** — treat it as directional. Within those months advertising ran ~48% of net revenue while the company still lost ~R\$300k/month: a paid-acquisition spiral, spending a rising share of sales to chase a falling top line.

4. What broke — and what the evidence does and doesn't prove

Big picture. The collapse is concentrated in **TikTok Shop**, driven by one viral product (Bio Estimulador). The own-site channel held up far better. **But** — addressing your C1 — I want to be precise about what the data proves.

Gross revenue by channel	nov/25	dez/25	jan/26	fev/26	mar/26	abr/26	Trend
TikTok Shop	965k	573k	174k	90k	128k	76k	–92%
Shopify (own site)	1,312k	987k	562k	476k	909k	597k	–54%, bouncing
B2B (DPSP)	74k	26k	59k	2k	0	0	dead

What the data supports: TikTok collapsed hardest (–92%), it was single-item impulse (1.0 item/order), and one SKU drove it (Bio Estimulador TikTok units 10,610→406). Shopify is multi-item (~2.8) and 32% of its orders repeat — structurally more durable.

What it does NOT prove (your point, conceded): the P&L logs marketing as a single "Propaganda e Publicidade Online" line — **it is not split by channel**. So I cannot prove the Shopify base is independent of the influencer/paid bloat. Your read — that the bloat lifted *all* channels — is the safer assumption. Practically: **the durable own-site base may itself shrink as paid spend normalises**. That is exactly why the case below is built on a break-even revenue (~R\$4.2M net) well under the current run-rate, not on the run-rate holding.

5. The durable core (order-by-order)

Big picture. We reconstructed all 89,648 invoice lines into 45,626 orders. The own-site business is a considered, repeat-purchase business — a real asset, even if its size is uncertain.

Channel	Mean AOV	Items/order	Character
Shopify (own site)	R\$200	~2.8	Considered baskets / kits
TikTok Shop	R\$90–148	1.0	Single-item viral impulse

Retention is real. Over six months, **32% of own-site orders came from repeat customers** (16.5% of customers). TikTok is almost entirely one-and-done. This is genuine brand equity — but note, with no cross-sell, monetising it still requires Bisyou's *own* acquisition engine to keep feeding new customers in.

Own-site destination mix: Southeast 57% (SP 37%, MG 10%, RJ 8%), South 15%, Northeast 17%, Centre-West 8%, North 3%.

6. Why this works for NAMI — purely operational

Big picture. There is **no demand synergy** in this deal. The edge is entirely cost structure: the owners ran a heavy fixed base and rented growth at retainer prices. We run a light base and buy growth at variable, performance prices. Same revenue, very different bottom line.

The cost base we would carry — with the build-up (your C5)

Line	Theirs (2026 ann.)	Ours	Build-up / why different
Debt service	~1.5M	0	No debt assumed in the licence
Working capital (stock)	funded by them	0	Boniteca finances; we pay M+2 after sale
Administrative	~1.6M	~0.3M	Bisyou Shopify+apps ~R\$110k; bookkeeping folded into our finance fn ~R\$120k; misc tools/fees ~R\$70k
People	~1.1M	~0.95M	1 brand/ops lead (loaded ~R\$220k) + allocated CX / mktg-ops / fulfilment-coord on our shared team (~R\$730k)
Advertising	~3.2M fixed (48% of net)	variable	CPA / affiliate via Flywheel <i>tooling</i> — pay on performance, no retainers. Illustrated at 25% of net below

The genuine synergies (operational only)

- Same manufacturer (Boniteca) and distributor model we already run; Boniteca also finances the stock.
- Shared fulfilment, admin platform (Omnify) and finance/ops team — the marginal cost of a second brand on the machine is low.
- The Flywheel affiliate/CPA **engine** as the variable-cost marketing model (the tooling and discipline — **not** GE's audience).

The prize, in numbers (illustrative — Shopify standalone run-rate)

Illustrative annual pro-forma	R\$
Net revenue (Shopify run-rate)	~7.6M
Gross profit (80%)	~6.1M
Selling + logistics + card (~17%)	(1.30M)
Variable marketing / CPA (25% of net)	(1.91M)
Lean fixed (people ~0.95M + admin ~0.30M)	(1.25M)
Royalty (8% of net)	(0.61M)
Estimated EBITDA	~R\$1.0M (14%)

Sensitivity (net R\$7.6M, 8% royalty)	Mktg 20%	Mktg 25%	Mktg 30%
EBITDA	~R\$1.42M	~R\$1.04M	~R\$0.66M

The asymmetry, restated honestly. The same brand that loses them ~R\$3M/yr could earn us ~R\$0.7–1.4M/yr — entirely from the cost structure, with no demand synergy assumed. **Break-even marketing is ~39% of net** (they ran 48% recently, 32% in their good year) and **break-even revenue is ~R\$4.2M net** vs a ~R\$7.6M run-rate. So revenue can nearly halve, or marketing can run far less efficiently than their best, and we still clear. That margin of safety is the case.

7. The risks, and where the trap lives

1. Standalone acquisition efficiency (the new #1). With no cross-sell, everything rides on buying Bisyou's customers at $\leq \sim 35\%$ of net. The incumbents — who knew the brand — ran 48%. If we can't beat that materially, the EBITDA evaporates. Mitigant: a paid test before we commit.

2. The own-site base keeps sliding / is spend-dependent. Mar (R\$909k)→Apr (R\$597k) dipped, and per \$4 we can't prove Shopify is independent of the old bloat. May/June is the tell.

3. The royalty is set wrong. Anything on gross, or with a minimum, transfers the fragility to us. Still unstated — we hold the pen.

4. Attention cost. A three-person team; every hour on Bisyou is an hour off GE Beauty.

5. Product / inventory risk (not working capital). Boniteca carries the stock, so no cash outlay — but some SKUs are liquids/glass (água micelar, sabonete) with breakage and shelf-life exposure, and demand on slow SKUs is uncertain.

8. Cost-to-serve: freight, corrected

Your C7 was right and I've corrected it. The "59% shipped free / R\$6.52" figure is what Bisyou **charged its customers** (a revenue/pricing choice), **not** its cost to ship. I conflated the two and wrongly claimed Unilog would "double" their cost. **Their actual carrier (J&T/R3) cost is not in the data**, so that comparison cannot be made yet.

What we *can* compute is our own cost-to-ship. We priced **every one of the 44,969 reconstructed orders** against GE's Unilog B2C table (origin: Serra/ES filial), by destination and basket:

Cost to ship via GE's Unilog contract	Value
Blended cost-to-ship per order	~R\$26
As % of AOV	~17%
Implied annual freight @ ~84k orders/yr	~R\$2.2M

Full per-order calculation, summary, and the rate-table assumptions are in **Bisyou-Unilog-Freight-Cost.xlsx**. UF-level representative rates; exact CEP→GEOCOM-zone mapping would refine within a UF. No weight data in the file, so cubed weight is inferred from basket size (Southeast bands are near-flat 0.25–2 kg, so this barely moves the dominant ~57% SE volume).

So the freight conclusion is now: our cost-to-ship is ~R\$26/order; whether that is cheaper or dearer than what Bisyou pays J&T/R3 today is **open until we see one month of their carrier invoices**. Don't assume a saving or a loss. The real fulfilment synergy is warehousing/pick-pack consolidation; the carrier itself should be chosen on the actual quote.

9. Deal terms and negotiation levers

- **Royalty:** cap at single digits of NET, no minimum; tie step-ups to revenue we actually rebuild.
- **Purchase option:** fix the strike now and low — we rebuild the equity during the licence; don't pay twice for our own work.
- **Marketing-efficiency proof:** structure a short paid test (or an earn-in) so we validate the $\leq 35\%$ -of-net acquisition before deep commitment.
- **Agency:** decide inherit-vs-break-fee on the Meta/Google contract (to Nov-2026); don't commit to its R\$60k/mo minimum beyond our plan.
- **Dead channels are upside, not value:** don't pay for DPSP/B2B (dead) or the TikTok peak. Price the durable base only.
- **Clean reps:** ANVISA active with dates, trademark uncontested, no live litigation, all access at closing.

10. Verdict and next steps

CONDITIONAL GO

The verdict survives your corrections, but the reasoning changed: the downside is **lower** than v1 (no working capital, no debt, clean licence), while the upside is **narrower** (no demand synergy — pure operational arbitrage). It holds because the cost structure tolerates a near-halving of revenue or marketing far less efficient than the incumbents' best. It fails if the royalty is greedy, the own-site base is still in free-fall, or we cannot prove standalone acquisition under $\sim 35\%$ of net.

Immediate next steps:

1. Ask Ivan for **May/June own-site revenue** and **one month of actual J&T/R3 carrier invoices**.
2. Get the **royalty terms and purchase-option strike** from Edson, in writing.
3. Design a **small standalone paid-acquisition test** to validate the $\leq 35\%$ -of-net marketing gate before committing.
4. Confirm **ANVISA / trademark / litigation** reps before any term sheet.
