

Bisyou — Should we take it on?

Confidential investment memo. Prepared by Claude (CTO/CFO) for Lucas Guimarães (CEO), NAMI Works / GE Beauty · 14 June 2026

Subject: licensing & operational takeover of Bisyou (skincare DNVB) under our structure. Sources: Bisyou Road Show deck, 5-year P&L, trial balances Jan–Apr 2026, and a 45,626-order reconstruction of the per-order sales file.

1. Recommendation at a glance

CONDITIONAL GO

Pursue to a term sheet, but only inside four hard gates. This is not the simple story we started with (“cut the bloated influencer spend and keep the revenue”). The data shows revenue falls when that spend is cut. The real case is different and, on balance, better: **a capped-downside call option on a durable, high-margin brand, run on infrastructure we already own.**

Big picture. Bisyou is a structurally unprofitable, shrinking brand (it lost money in four of its last five years and is burning roughly R\$3M a year now). On its own numbers it looks like a trap. But the licensing structure isolates us from its liabilities, and our cost base would be nothing like theirs. Underneath the collapse sits a **durable, repeat-driven, ~80%-margin own-site business of roughly R\$7–9M a year** that, run lean on our shared machine, is comfortably profitable. The part that collapsed was a viral TikTok channel that does not require us to keep it alive to make the deal work. That asymmetry, limited downside against a real and additive upside, is why this is worth pursuing.

The four gates (all must hold, or we pass):

1. **Royalty $\leq$ ~5–8% of net revenue, with no fixed minimum.** A royalty on gross, or a guaranteed minimum, breaks the math given the brand’s fragility.
2. **May/June own-site (Shopify) revenue is stabilising, not still sliding.** One more data point decides whether we are buying a base or catching a falling knife.
3. **A license term long enough, and cheap enough to exit,** to prove the model before any purchase obligation; plus clean ANVISA registrations, trademark, and no live litigation.
4. **We cap the leadership attention we commit.** The hidden cost is our own bandwidth pulled off GE Beauty, not cash.

2. What is actually on the table

Big picture. This is a **brand-licensing and operational takeover**, not an acquisition. We would run Bisyou and pay the owners a royalty, with an option to buy the brand later (referenced around year five). We take the operation; we do not take the balance sheet.

Structure (clean handover)

- **No liabilities transferred:** no labour liabilities, no bank debt, and none of the ~R\$1.9M legacy supplier payables. Anything pre-closing stays with the current owners.
- **Supply unchanged:** products are made by **Boniteca** — the same manufacturer that makes GE's lines (José Nardi is on every thread). Same distributor model, same payment terms. Boniteca's fee is a 10%→5% regressive success fee, paid only after sale.
- **We fund inventory from day one** (~R\$1M; Dec-2025 stock was R\$611k in SP + R\$353k in MG, inventory turns ~3×).
- **Marketing today:** all influencer contracts already cancelled; the Meta/Google agency runs to Nov-2026 (~R\$60k/mo media + R\$6.5k service, with a break fee).

Who we are dealing with

Owners (cap table): **Disruptive Participações S/A 76%**, Ivan Pinheiro 12%, Carolina Viudes 12%. A financial holder controlling 76% and licensing out operations is a mild **negative-selection signal** — they could not fund or fix it themselves and want optionality without losing the asset. That is fine, but it is exactly why the royalty and the eventual purchase price must be priced as the call option this is.

3. The brand's financial reality

Big picture. Bisyoun scaled to ~R\$15M of revenue in 2024 and made money in exactly one year. The cost of buying its customers always ate the (excellent) gross margin. In 2025 it swung to a R\$1.8M net loss, and 2026 is running ~46% below 2025 with a ~R\$3M annual burn.

R\$ (Contábil view)	2021	2022	2023	2024	2025
Gross revenue	2.47M	6.40M	9.81M	15.44M	14.79M
Gross margin	77.5%	82.4%	84.5%	85.2%	80.2%
Commercial spend (mktg)	0.91M	2.34M	3.14M	4.45M	5.20M
Net profit / (loss)	(0.20M)	(0.22M)	(0.40M)	0.62M	(1.78M)

By early 2026 the picture worsens: advertising reached **~48% of net revenue** and the company still lost ~R\$300k a month. That is a paid-acquisition death spiral — spending a rising share of sales to chase a falling top line, because the return on that spend had broken.

4. What actually broke: a viral channel, not the brand

Big picture. The collapse is concentrated in **one channel** — **TikTok Shop** — driven by one viral product (the Bio Estimulador, the “needle-free Cinderella effect” hero). That is a viral-decay curve, not a brand failure. The own-site business held up far better.

Gross revenue by channel	nov/25	dez/25	jan/26	fev/26	mar/26	abr/26	Trend
TikTok Shop	965k	573k	174k	90k	128k	76k	-92%
Shopify (own site)	1,312k	987k	562k	476k	909k	597k	-54%, bouncing
B2B (DPSP pharmacy)	74k	26k	59k	2k	0	0	dead

Why this matters. The revenue we would actually inherit is the **own-site Shopify base (~R\$7–9M/yr), not the R\$15M peak**. The TikTok/affiliate channel becomes **optional upside** we can choose to re-light, not a life-support machine we must keep running. That reshapes the whole risk profile.

5. The durable core (order-by-order evidence)

Big picture. We reconstructed all **89,648 invoice lines into 45,626 orders**. The own-site business is not rented traffic: it is a considered, multi-item, repeat-purchase business. That is the single most important finding in this memo.

Channel	Mean AOV	Items / order	Character
Shopify (own site)	R\$200	~2.8	Considered baskets / kits
TikTok Shop	R\$90–148	1.0	Single-item viral impulse

Retention is real. Over a six-month window, **32% of own-site orders came from repeat customers** (16.5% of customers repeating). TikTok, by contrast, is almost entirely one-and-done. Because the window is short and we matched on name, true repeat is higher than this. **~1/3 of own-site demand repeating in six months is genuine brand equity** — the best evidence that the base is durable, not bought.

Own-site destination mix: Southeast 57% (SP 37%, MG 10%, RJ 8%), South 15%, Northeast 17%, Centre-West 8%, North 3%.

6. Why this is attractive for NAMI specifically

Big picture. The owners could not make Bisyoun pay because their cost base was heavy and their growth was rented. **Our cost base would be radically lighter, and our growth engine is owned.** The same revenue runs at a completely different bottom line on our machine.

The cost base we would actually carry

Cost line (their 2026 annualised)	Theirs	Ours	Why different
Debt service (financeiras)	~1.5M	0	No debt assumed
Administrative (accounting, software)	~1.6M	~0.3M	Runs on Omie/Shopify/team we already operate
People	~1.1M	~0.5–1.0M	We absorb no staff; lean crew
Advertising	~3.2M fixed	variable	CPA affiliates + owned audience, not retainers

The genuine synergies

- **Same manufacturer (Boniteca)** and distributor model we already run.
- **Shared fulfilment, admin platform (Omnify), and finance/ops team** — the marginal cost of a second brand on the machine is low.
- **The Flywheel affiliate/CPA engine** is exactly the variable-cost replacement for the dead influencer model. Bisyou becomes a second tenant on a system we are already building.
- **An owned beauty audience Bisyou never had:** the GE base and Camila Coutinho's reach, to cross-sell skincare at near-zero acquisition cost — instead of renting reach from influencers.

The prize, in numbers (illustrative)

On the durable Shopify base alone (~R\$8M gross, ~R\$6.8M net, 80% margin), run on our cost base with a variable CPA layer and an 8% royalty:

Illustrative annual pro-forma (Shopify base only)	R\$
Net revenue	~6.8M
Gross profit (80%)	~5.4M
Selling + card fees (~14%)	(0.95M)
Variable marketing / CPA (~15%)	(1.0M)
Lean fixed (team + marginal admin)	(1.25M)
Royalty (8% of net)	(0.54M)
Estimated EBITDA contribution	~R\$1.6M

The asymmetry. The same brand that loses them ~R\$3M/yr could contribute on the order of **~R\$1.5–2M/yr** on our base, before any TikTok/affiliate upside. Break-even sits near **~R\$4M of gross revenue**, so the own-site base could fall by roughly half again from today and we would still be around break-even. Downside is bounded to our operating cost, ~R\$1M of working capital, and our attention — and we can walk at the end of the license.

7. The risks, and where the trap lives

1. The own-site base keeps sliding. March (R\$909k) to April (R\$597k) was a dip. If the Shopify line is still falling, not stabilising, we are buying a melting asset. **This is the single most important thing to confirm (May/June).**

2. The royalty is set wrong. Anything on gross, or with a minimum, transfers the fragility onto us. The deck does not state the royalty; it is still to be negotiated, so we hold the pen here.

3. We cannot re-light demand efficiently. Our whole upside rests on replacing rented influence with owned audience + CPA. It is our core competency, but it is unproven on this brand.

4. Attention cost. A three-person team. Every hour on Bisyou is an hour off GE Beauty. This belongs in the decision, not just the model.

5. Inventory and product risk. We fund ~R\$1M of stock into uncertain post-cut demand; some SKUs are liquids/glass (água micelar, sabonete) with breakage and shelf-life exposure.

8. Cost-to-serve: do not move freight to Unilog

Big picture. We priced every reconstructed order against GE's Unilog B2C table using its real destination and basket. **Unilog would cost ~R\$28–29/order (~15% of AOV)** — but Bisyou ships today via **J&T Express and R3**, budget light-parcel couriers, with 59% of orders shipped free.

Migrating Bisyou's last-mile to Unilog would likely roughly double freight cost (order of ~R\$1M/yr added on ~7,000 orders/month). Keep them on J&T/R3 or tender it. The fulfilment synergy is warehousing and pick/pack consolidation, **not** the carrier. Confirm with one month of their actual carrier invoice.

Note: the sales file carries no weight or dimension data, so cubed weight is inferred from basket size. Unilog's Southeast rate bands are nearly flat across 0.25–2 kg, so this barely moves the dominant ~57% Southeast volume.

9. Deal terms and negotiation levers

- **Royalty** is the whole game: cap it at single digits of **net** revenue, no minimum. Tie any step-ups to revenue we actually rebuild.
- **Purchase option:** fix the strike now and low — we will be the ones rebuilding the equity during the license; do not pay twice for our own work.
- **Agency:** decide inherit-vs-break-fee on the Meta/Google contract (to Nov-2026); do not commit to its R\$60k/mo minimum beyond our plan.
- **Dead channels are upside, not value:** do not pay for DPSP/B2B (dead) or for the TikTok peak. Price the durable base only.
- **Clean reps:** ANVISA registrations active with dates, trademark uncontested, no live consumer litigation, all access handed over at closing.

10. Verdict and next steps

CONDITIONAL GO Take it on **if and only if** the four gates in Section 1 hold. The structure gives us a high-margin, repeat-driven brand on infrastructure we already own, with bounded downside and a credible, owned-audience path to upside. It fails if the royalty is greedy or the own-site base is still in free-fall.

Immediate next steps, in order:

1. Ask Ivan for **May and June own-site revenue** (the stabilisation test) and **one month of actual J&T/R3 carrier invoices** (the freight test).
2. Get the **proposed royalty terms and purchase-option strike** from Edson, in writing.
3. Have Claude **build the live unit-economics model** (dials: own-site retention %, royalty %, CPA re-ignition %) so we negotiate from a break-even royalty ceiling, not a feeling.
4. Confirm **ANVISA / trademark / litigation** reps before any term sheet.
